

# Probob Design Studio Website — Feature Gap Analysis & Enhancement SRS

Prepared from direct analysis of the uploaded Flask project ZIP

|               |                                                 |
|---------------|-------------------------------------------------|
| Project       | Probob Design Studio Website                    |
| Project Type  | Flask + SQLite agency website                   |
| Document Type | Feature gap analysis and enhancement SRS        |
| Prepared For  | Website enhancement planning / final submission |

## Summary

This document was prepared after directly reviewing the uploaded project structure, Flask routes, database schema, and admin/user flows. It lists the features that are already implemented and the specific real-world features that still need to be added or enhanced.

### 1. Current Website Scope Identified

- Flask-based website with SQLite database and server-rendered HTML templates.
- Authentication system is implemented with sign up, login, logout, session handling, forgot password, reset token generation, and admin/user role separation.
- Public-facing content pages already exist: Home, Portfolio, Case Studies, Showreel, Services, Process, Pricing, About, Team, Careers, Blog, FAQ, and Contact.
- Lead capture features already exist: contact form, newsletter subscription, and careers/job application submission.
- Admin panel already exists with CRUD for Services and Pricing Packages.
- User dashboard and separate admin dashboard are already available.
- JSON API endpoints already exist for portfolio, testimonials, and basic stats.
- Seeded CMS-like content already exists for blog posts, portfolio items, testimonials, services, and pricing packages.

### 2. Existing Functional Features Confirmed

- User registration and login
- Role-based access control (admin vs user)
- Forgot-password and reset-password flow
- Protected internal pages after login
- Portfolio listing with category filter
- Blog listing with category filter and single-post view
- Pricing packages display
- Services listing from database

- 
- Testimonials display
  - Newsletter subscription
  - Contact form storage
  - Careers page with application submission
  - Admin dashboard with key statistics
  - Admin CRUD for services
  - Admin CRUD for pricing packages
  - Basic JSON APIs

### 3. Major Real-World Features Missing

- No client project onboarding workflow
- No request-a-quote / design brief module
- No consultation booking system
- No client project tracking timeline/status module
- No file upload / asset sharing system
- No revision request workflow
- No invoice / payment tracking
- No portfolio CMS CRUD in admin
- No blog CMS CRUD in admin
- No testimonial management CRUD in admin
- No contact lead management actions (assign/update/respond/archive)
- No user-specific dashboard data; current dashboard shows global platform counts instead of personal client activity
- No notifications or email workflow for inquiries, bookings, approvals, or status changes
- No scanner / QR feature yet
- No analytics for leads, services, conversions, or project pipeline
- No downloadable deliverables area for clients
- No appointment calendar integration
- No chatbot or guided project intake assistant

### 4. Priority Enhancements Required

- 4.1 Client Onboarding Module: Add a structured 'Start a Project' flow where a client selects service, budget range, deadline, business type, and project description.
- 4.2 Quote Request System: Store quote requests in the database and show them in admin with status values such as New, Reviewing, Quoted, Accepted, Rejected.
- 4.3 Client Dashboard Upgrade: Replace generic counts with client-specific items such as submitted inquiries, active projects, pending revisions, files received, invoices, and final deliveries.

- 
- 4.4 Project Management Module: Create project records with status values like Inquiry Received, Discovery, In Progress, First Draft Sent, Revision Round, Final Delivery, Closed.
  - 4.5 File Upload Module: Allow clients to upload briefs, brand references, logos, images, scanned documents, and payment proofs.
  - 4.6 Revision Request Workflow: Allow clients to submit revision notes per project with revision number, comments, and attachment support.
  - 4.7 Admin Lead Management: Add admin actions for contact messages, quote requests, and applications such as mark as contacted, in discussion, converted, archived.
  - 4.8 Portfolio CMS CRUD: Admin should be able to create, edit, delete, feature, and categorize portfolio items from dashboard.
  - 4.9 Blog CMS CRUD: Admin should be able to add and manage blog posts directly from dashboard.
  - 4.10 Testimonial CMS CRUD: Admin should be able to manage testimonials and client reviews.
  - 4.11 Payment/Invoice Tracking: Add invoice records, payment status, and proof-of-payment upload.
  - 4.12 Email Notification Layer: Send email on signup, inquiry submitted, quote sent, project started, revision requested, and final delivery.
  - 4.13 Consultation Booking: Add a schedule/booking form for free consultation or discovery call.
  - 4.14 Scanner + QR Features: Add scanner-based input and QR utilities relevant to a design agency.

## 5. Scanner Features Recommended for This Website

- Business Card Scanner: Client or admin can scan a business card and auto-fill lead name, email, phone, and company.
- Design Brief Scanner: Client can scan handwritten notes, sketches, or printed briefs and attach them to a project.
- QR Code Generator for Portfolio: Generate QR codes for each portfolio case study for offline sharing.
- QR Code for Payment / Invoice Access: Give clients a QR that opens invoice details or payment confirmation page.
- Document Upload from Camera: Mobile users should be able to capture and upload reference documents directly from device camera.

## 6. Admin Panel Enhancements Still Needed

- Separate modules/tabs for Leads, Quotes, Projects, Portfolio, Blog, Testimonials, Files, Invoices, and Payments.
- Search, filter, and status badges across admin tables.
- Pagination for large data sets.
- Ability to export inquiries or project summaries to CSV/PDF.
- Role extension for team members (admin, manager, designer, client).
- Dashboard charts based on real database values instead of static hardcoded trend arrays.

## 7. Database / Backend Modules to Add

- quotes

- 
- projects
  - project\_files
  - revision\_requests
  - invoices
  - payments
  - project\_status\_history
  - bookings
  - portfolio\_admin\_assets
  - notifications

## 8. Non-Functional Enhancements Required

- Use stronger password hashing such as werkzeug.security / bcrypt instead of plain SHA-256.
- Add input validation for forms and file uploads.
- Add file type and file size restrictions.
- Add CSRF protection for forms.
- Add proper email templates.
- Improve access control so APIs and internal data are role-safe.
- Make dashboard analytics dynamic and database-driven.
- Add responsive/mobile-first improvements for client workflows such as upload and scan.

## 9. Recommended Final Build Scope for Real-World Version

- Phase 1 (Must Have): Quote request, project onboarding, file upload, project tracking, revision workflow, admin lead management, portfolio/blog/testimonial CRUD.
- Phase 2 (High Value): Consultation booking, invoice/payment tracking, notifications, downloadable final files, real analytics dashboard.
- Phase 3 (Differentiator): Business card scanner, brief scanner, QR portfolio cards, smart intake assistant/chatbot.

## 10. Final Conclusion

- The current website is strong as a branded agency showcase with authentication, dashboards, lead capture, and partial admin CRUD already completed.
- To become a real-world agency platform, it now needs operational modules: quote management, project lifecycle tracking, uploads, revisions, invoicing, richer admin controls, and scanner/QR-based client interaction.
- Your next development focus should be business workflow features, not more static pages.
